

Latest U. of Utah Distracted Driving study (November 2015):

[This study](#) included changes in the tests that were run and the demographics of the participants. The previous tests included doing things like reading e-mails (via TTS) which are rarely done by users. The users being tested were all U of Utah students. In this study, the users actions were things that were commonly done like voice dialing and radio tuning. The study participants were expanded and now included a distribution of ages, including seniors. Unfortunately – the participants were all selected from the Utah region.
